

Save Earth.

There are eight planets in our solar system. But it is only earth where life is possible.

The atmosphere and the presence of oxygen makes it different from other planets. Earth is called the blue planet as it contains water. We have all the things needed for our daily life. On the whole it is our mother.

But now a days we people are not taking much care about the earth. We throw plastics and other non-degradable materials in the soil knowing that it will stay in earth for millions of years. We use chemical fertilisers and pesticides which decreases the quality of the soil and make it less fertile. But we people are dumb and dough to realise the truth that we are causing harm to ourselves. The coming generation may curse us like anything.
